Acknowledgements

Past and present Utah Division of Energy staff made valuable contributions to this project. Kevin Gillars, Glen Hansen, Britt Reed, Oliver Schreiber, Tom Turner and Dana Wilson contributed to the data collection and preparation of this document. Questions or comments about this publication or wind energy production in Utah should be directed to Tom Turner at the Utah Division of Energy.

The Utah Division of Energy extends its appreciation to the Western Area Power Administration for supporting this project and providing the wind monitoring equipment. Special thanks goes to the many government agencies, corporations, municipalities and private landowners for their cooperation in providing land for installation of equipment and access to monitoring sites.

ntroduction

Wind energy is gaining acceptance worldwide as an important source of electrical power. Technological advances during the past decade have dramatically increased the wind turbine's efficiency and cost effectiveness. As a result, today's utility-scale electric generation plants powered by wind produce significant amounts of energy. The United States now has 1,600 MW of wind-generated power capacity on line. In 1991, California alone produced 2.7 billion kwh of wind-generated electricity, enough to meet the residential needs of approximately 300,000 people.

Wind energy is a promising renewable energy that offers utilities and independent power producers a pollution-free source of electricity that is cost competitive in areas where electricity rates are above average and winds are good. For years, the wind industry's goal has been to generate power at costs close to those of coal and oil — about six cents per kwh. Ten years ago, the cost of wind-generated power was four times that price. Today, wind turbines produce power at about seven cents per kwh. Current technology could lower that cost to five cents by 1995, and further technologi-

cal advances could reduce it to three and a half cents by 2005.

Technological advances have perfected the wind turbine's ability to harness the wind. Improvements such as aerodynamically efficient blade design and special wind direction sensors that align the machine toward the wind path have increased power output.

Other improvements, such as those used in U.S. Windpower, Inc.'s variable-speed wind turbine, correct serious problems that have plagued wind turbines for decades. Strong gusts of wind frequently damaged earlier wind turbines, placing enormous stress on the drivetrain transmission and blades causing mechanical failures and increasing operating costs. The variable-speed wind turbine, which increases and decreases speed with wind strength, converts the additional energy produced by gusts into electricity without increasing torque on the drivetrain. The variable-speed wind turbine, currently being field tested, is scheduled to go into production in early 1993.

Advanced technology is not the only factor driving increased use of wind power. The removal of institutional barriers and implementation of tax incentives are also nurturing this growing market. In 1978, Congress passed the Public Utility Regulatory Policies Act, which directs utilities to interconnect with independent power producers and purchase their excess electricity at fair market price.

To promote wind energy development in Utah, the Utah Division of Energy administers a program that offers state income tax credits of up to \$1,500 for residences using alternative energy systems and up to \$25,000 for commercial installations. The tax credits are scheduled to expire in December 1995.

While California, with its nearly 18,000 wind turbines, is the world leader in wind energy production, other areas of the nation have favorable wind regimes as well — including Utah. Throughout the state are nu-

merous locations where wind resources could generate electricity. The *Utah Wind Survey Report* serves as a prospector's guide to these areas. It provides a starting point for further detailed site-specific wind monitoring in order to develop the full potential of this valuable resource.

Research and development during the past decade has pushed back the frontiers of wind energy technology, making it more efficient and cost effective. Further technological advances will ensure that this reliable, non-polluting energy source will be cost competitive before the end of the century. With most of the institutional, technological and economic barriers removed, the only obstacle remaining to the widespread use of wind power for electricity generation is our nation's commitment to this important energy source. Wind power has come of age.

If ind Source and Measurement

The primary cause of wind is solar energy. Heat from the sun warms the Earth's water and land masses, which in turn warms the air above it. Warm air from the tropics rises, creating a region of low pressure. Colder air from the polar regions flows in to replace the warm air, creating dynamic streams of wind. The Earth's rotation, combined with local weather and landscape conditions shape the wind into a powerful source of energy.

The main instrument used in modern wind measurement is the rotating cup anemometer. In 1930, the three-cup anemometer was adopted as the standard by the National Weather Service. All data in the *Utah Wind Survey Report* was recorded with standard three-cup anemometers. Anyone recording wind velocity data using cup-style anemometers should be aware of the limitations of this method of measuring wind potential. First, four-cup anemometers typically over-measure the actual wind speed by approximately 24

percent at 100 mph, while modern three-cup anemometers over-measure up to 9 percent. Secondly, during brief periods of decreasing wind speed, all anemometers continue to rotate at a higher speed than the actual wind velocity.

Finally, poorly maintained anemometers require higher starting velocities that adversely affect data collection when wind speeds are less than 10 mph. Some of the instruments used in this study could respond to speeds as low as 0.5 mph, others required up to a 4.0-mph starting speed. Some of the data collection sites in this report were in remote locations, making it difficult to ensure the anemometers were maintained in peak operating condition.

I ind Power Units

A Wind Power Unit is a theoretical measure of wind energy potential. A wind power unit is expressed in watts per meter squared (W/m²) and is a function of air density and wind speed.

Theoretical wind power units are calculated by using the equation:

$$Pu=^{1}/_{2} [dv^{3}]$$

Where:

Pu= Power per unit area (W/m²)

d= Air density in kilograms per cubic meter (kg/m³)

v= Wind speed in meters per second

Values obtained estimating wind power represent theoretical maximums. In practice, the maximum power that can be obtained from harnessing a wind source is approximately 16/27 of the theoretical amount.

Under normal circumstances, measured wind power for a given wind velocity decreases at higher altitudes. For every 2,700-foot increase in elevation, the density and energy potential of air decreases about 10 percent, in turn decreasing the estimated energy potential. The standard sea level density of air is 1.29 kg/m³.

Estimates of wind power can be calculated from velocities averaged over time periods greater than one hour, but this method tends to underestimate the actual power that could be produced. For example, wind power calculated from a constant daily wind speed of 20 mph would produce a value of 461 W/m². However, if the wind speed were 10 mph half the time and 30 mph the other half, the mean would still be 20 mph, but the calculated wind power resulting from this profile of wind velocity would be 807 W/m².

echnical Background

During this wind survey project, 35 anemometer sites were monitored throughout the state between November 1984 and June 1991. State-of-the-art wind resource assessment tools and techniques were used to quantify wind rose, wind speed and diurnal distribution characteristics over a wide range of territory and terrain.

Second Wind AL-2000 data loggers, Maximum #40 anemometers and Downeastern TRX-WP wind vanes were used for data collection. At most locations, equipment was installed on a NRG Systems 20-meter Tall-tower. In some locations, existing wooden power poles or other tall-standing structures were used for the anemometer and data logger.

Wind data was recorded and stored on Second Wind Inc. data chips, then loaded into the Utah Division of Energy Data Information System (EDIS).

Data Format

Geographic information, environmental conditions and other descriptive parameters are identified for each site studied. The *Terrain Classifications in Each of the Principal Directions* are eight standard generic classes for categorizing the predominant land characteristics to the north, south, east and west of the wind measurement sites. The standard categories are:

A= Lake

B= Low grass, fallow ground

C= High grass, low row crops

D= Tall row crops, low woods

E= High woods with many trees

F= Buildings and structures

G= Relatively flat terrain

H= Rolling terrain

The AL-2000 data loggers used in this study report wind data in three different formats: Wind Velocity Distribution Data, Wind Diurnal Data and Wind Rose Data for each location.

The AL-2000 data loggers record hourly data from zero to a maximum of 255 hours in any single format. The 255-hour maximum had a minor effect on Wind Velocity Distribution Data and Wind Rose Data compiled in this document. The Wind Rose Data was corrected, but the Wind Velocity Distribution Data was left unchanged because all 255-hour maximum errors occurred at speeds under 10 mph, the realistic minimum wind speed needed for power generation.

Wind Velocity Distribution Data is divided into 18 different wind speed regimes. A wind speed regime is a segment of partitioned wind velocities. Within these wind speed regimes, the cumulative hours per month are listed for the particular wind velocity. This type of data presentation provides detailed information for use in technical analysis using wind velocities.

Diurnal information is averaged wind velocity data divided into 12 daily two-hour time slots, then each time slot is averaged for the month. The Wind Diurnal Data tables incorporate two rows of information for each month. The upper row represents the monthly av-

eraged wind speed for the particular time slot and the lower row contains the standard deviation (σ) for the monthly velocity averages. The Wind Diurnal Data gives peak wind power availability for comparison with local grid demand cycles.

The third type of data presentation, Wind Rose Data tables, provides prevailing wind direction. These tables contain eight major wind directions on one axis and four different wind speed regimes on the other axis. Monthly hours of wind speed in a particular direction are accumulated for use in optimizing the position of a turbine in relation to the predominant wind direction. This data also shows seasonal changes in wind characteristics.

Each site location also contains a graphic illustration based on the recorded value of Wind Velocity Distribution Data titled *Accumulated Hours of Wind Speed Equal To or Higher Than 10 MPH*. Each graph illustrates the potential operating time in hours for a wind turbine with a cut-in speed of 10 mph.

Jower Law Analysis

Wind speed generally increases with height from the ground and is a function of ground surface roughness and vertical temperature distribution. The change in wind speed is greatest closest to the earth's surface in open flat areas. Urban and forested areas cause near-surface turbulence that mixes air, decreases near-surface wind speeds and increases wind speed a few hundred feet above the ground. Power law analysis is a method of estimating wind velocity at varying heights for a specific location.

For most anemometer sites in this report, wind velocity data was collected at the fixed anemometer height of 20 meters, the hub height of most standard wind-generated electricity systems. Power law analysis is a simple method of predicting wind velocity above or below this 20-meter height.

The power law equation is expressed as:

$$V_h = V_L \left[\frac{H_h}{H_I} \right]^{\alpha}$$

Where:

V_h= Upper anemometer wind velocity

V_L= Lower anemometer wind velocity

H_h= Elevation of the upper anemometer

 H_1 = Elevation of the lower anemometer

The α exponent in the power law equation is functionally dependent on surface roughness and wind stability. Empirical studies define an α value of 0.14 as appropriate for most sites.

Power law analysis was performed with data collected at the Spanish Fork Canyon C and D locations in Utah County. The C anemometer operated at a height of 29 meters (95 feet) and the D anemometer operated from a height of 19.8 meters (65 feet) on the same tower.

The purpose of this analysis was to determine the validity of the 0.14 power law exponent for conditions at Spanish Fork Canyon, and to calculate a power law exponent specifically for the area. The exponent was

then used to estimate wind velocities at varying heights for the remaining Spanish Fork Canyon sites.

To determine a power law exponent for Spanish Fork Canyon the equation was transformed to:

$$\alpha = \frac{\log \left[\frac{V_h}{V_L}\right]}{\log \left[\frac{H_h}{H_L}\right]}$$

The α exponent value was calculated using the average of the 12 monthly Wind Diurnal Data values for each time period. A power law exponent was then calculated for each month in each individual time period. The mean of the 12 monthly power law exponent averages is the correct adjusted power law exponent for use in other equations.

Results of the computation are shown in Table 1 (page ix). The table indicates an approximate 35 percent change in the α value over a 24-hour period. Appropriately, the monthly average α values vary less than the individual monthly values. The importance of

the variation between lowest and highest values of the diurnal averages increases directly with the value of the ratio H_h/H_L . A value of 0.294 can be used as an estimate of α for the Spanish Fork Canyon C and D locations, projecting velocities to turbine hub heights of up to 30 meters above or below where the actual data was recorded.

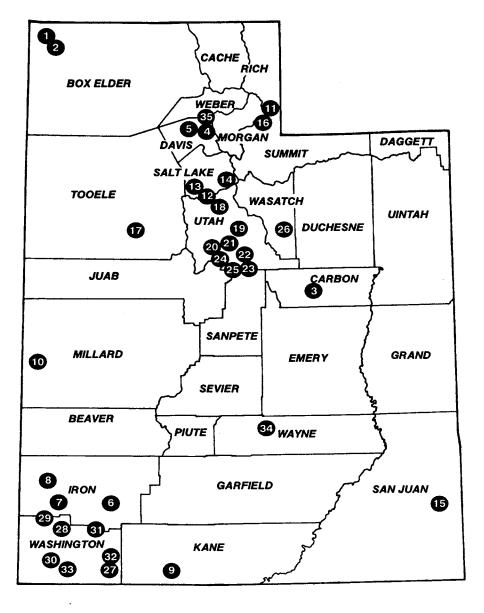

Similar wind patterns, wind stability and surface roughness conditions exist at the other canyon locations. Therefore, assigning α the value of 0.3 should be reasonably valid for the remaining Spanish Fork Canyon locations and other similar canyon wind sites such as Weber and Ogden canyons in Weber County.

However, wind speeds do not always increase with height from the ground as the power law suggests. Frequently, the power law α exponent varies too greatly to be explained by terrain alone. Many poorly understood factors exist that affect the vertical variation of wind speeds. Serious wind energy prospectors should always accurately measure potential wind power sites to determine true conditions, rather than rely on data from other locations or elevations.

Table 1 The Power Law Exponent For Spanish Fork Canyon, Sites C and D

Site Description

County:

Box Elder

Township:

13 North

Section:

11

Longitude:

113° 45'

Elevation:

6,900 ft.

Range:

17 West

Quarter Section:

Latitude:

46° 38'

Duration of data logging:

November 1984 to April 1987

Months of available data:

30

Anemometer height:

50 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Southwest

Terrain classification in each of the principal directions:

North:

Rolling terrain

East:

Low grass, low row crops

South:

Rolling terrain

West:

Low grass, low row crops

Comments

Property ownership:

Raft River Electric Cooperative

Site selection:

Field survey of topography

CARBON COUNTY

Price	Page
Site Description	23
Wind Velocity Distribution Data Table	24
Wind Speed Figure	25
Wind Diurnal Data Table	26
Wind Rose Data Table	28

Site Description

County:

Carbon

Township:

14 South

Section:

25

Longitude:

110° 45'

Elevation:

5,500 ft.

Range:

10 East

Quarter Section:

Latitude:

39° 35'

Duration of data logging:

April 1985 to July 1986

Months of available data: 16

Anemometer height:

65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: North-Northwest

Terrain classification in each of the principal directions:

North:

Low grass, low row crops

East:

Low grass, low row crops

South:

Rolling terrain

West:

Low grass, low row crops

Comments

Property ownership:

Private

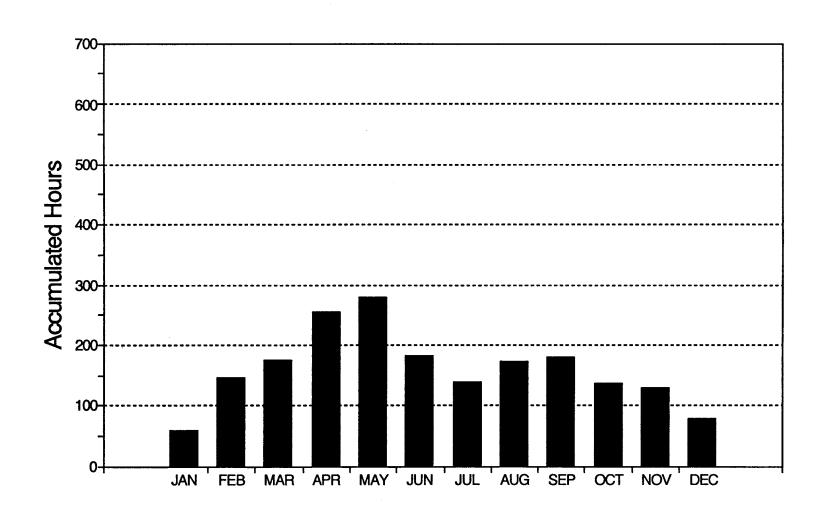

Site selection:

Field survey of topography

Site Description

County:

Davis

Township:

5 North

Section:

26

Longitude:

111° 55'

Elevation:

4,600 ft.

Range:

1 West

Quarter Section:

Southeast

Latitude:

41° 05'

Duration of data logging:

May 1985 to June 1991

Months of available data:

40

Anemometer height:

65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Northeast

Terrain classification in each of the principal directions:

North:

Low grass, low row crops

East:

Low grass, low row crops

South:

Low grass, low row crops

West:

Low grass, low row crops

Comments

Property ownership:

Utah Department of Transportation

Site selection:

Field survey of topography

Site Description

County:

Davis

Township:

5 North

Section:

26

Longitude:

111° 55'

Elevation:

4,600 ft.

Range:

1 West

Quarter Section:

Southeast

Latitude:

41° 05'

Duration of data logging:

May 1985 to January 1987

Months of available data: Anemometer height:

21 65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Northeast

Terrain classification in each of the principal directions:

North:

Low grass, low row crops

East:

Low grass, low row crops

South:

Low grass, low row crops

West:

Low grass, low row crops

Comments

Property ownership:

Utah Department of Transportation

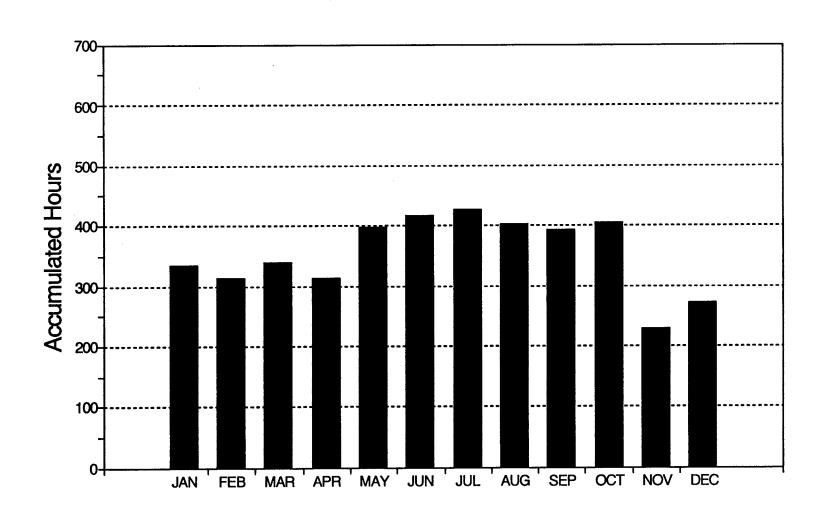

Site selection:

Field survey of topography

Site Description

County:

Salt Lake

Township:

4 South

Section:

24

Longitude:

111° 55'

Elevation:

5,300 ft.

Range:

1 West

Quarter Section:

Latitude:

40° 28'

Duration of data logging:

May 1985 to May 1988

Months of available data: 23

Anemometer height:

50 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Varies with time of year Terrain classification in each of the principal directions:

North:

High grass, low row crops

East:

High grass, low row crops

South:

High grass, low row crops

West:

Rolling terrain

Site Description

County:

Salt Lake

Township:

2 South

Section:

27

111° 55' Longitude:

Elevation:

4,250 ft.

Range:

1 West

Quarter Section:

Latitude:

40° 39'

Duration of data logging:

August 1986 to October 1989

Months of available data: 25 Anemometer height:

50 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Varies with time of year Terrain classification in each of the principal directions:

North:

High grass, low row crops, Buildings and structures

East:

Buildings and structures

South:

High grass, low row crops

West:

High grass, low row crops

Comments

Property ownership:

Salt Lake City Corporation.

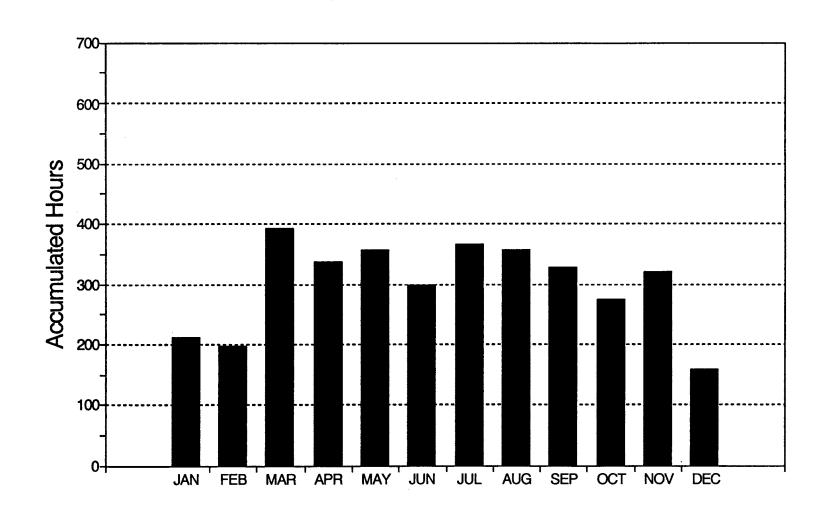

Site selection:

To serve as reference station for Salt Lake Valley winds.

Site Description

County:

Salt Lake

Township:

3 South

Section:

7

Longitude: 111° 38'

Elevation:

11,800 ft.

Range:

3 East

Quarter Section:

Latitude:

40° 35'

Duration of data logging:

July 1985 to February 1986

Months of available data: 7
Anemometer height: 30

30 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Not available, faulty wind vane Terrain classification in each of the principal directions:

North:

Rolling terrain

East: South: Rolling terrain

West:

Rolling terrain Rolling terrain

Comments

Property ownership:

Snowbird Corporation

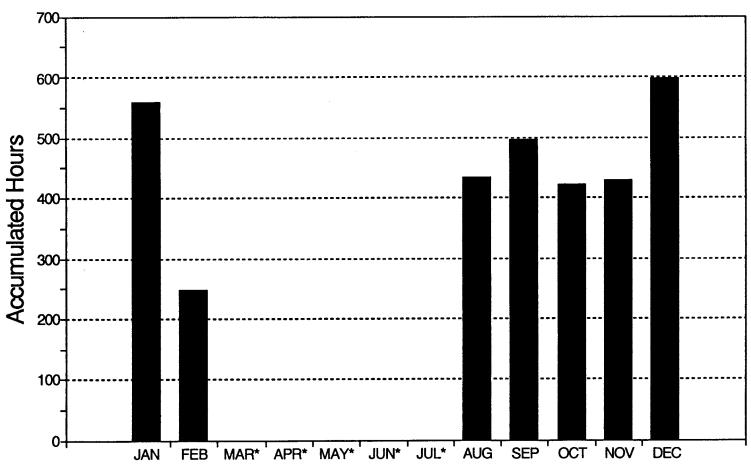

Site selection:

To serve as a reference station for high elevation, mountain winds.

TOOELE COUNTY

Skull Valley	Page
Site Description	151
Wind Velocity Distribution Data Table	152
Wind Speed Figure	153
Wind Diurnal Data Table	154
Wind Rose Data Table	156

Site Description

County:

Tooele

Township:

5 South

Section:

Longitude:

26

112° 43'

Elevation:

4.600 ft.

Range:

8 West

Quarter Section:

Latitude:

40° 22'

Duration of data logging:

August 1985 to November 1986

Months of available data: 16

Anemometer height:

65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Southeast

Terrain classification in each of the principal directions:

North:

High grass, low row crops

East:

High grass, low row crops

South:

High grass, low row crops

West:

High grass, low row crops

Comments

Property ownership:

Goshute Tribe.

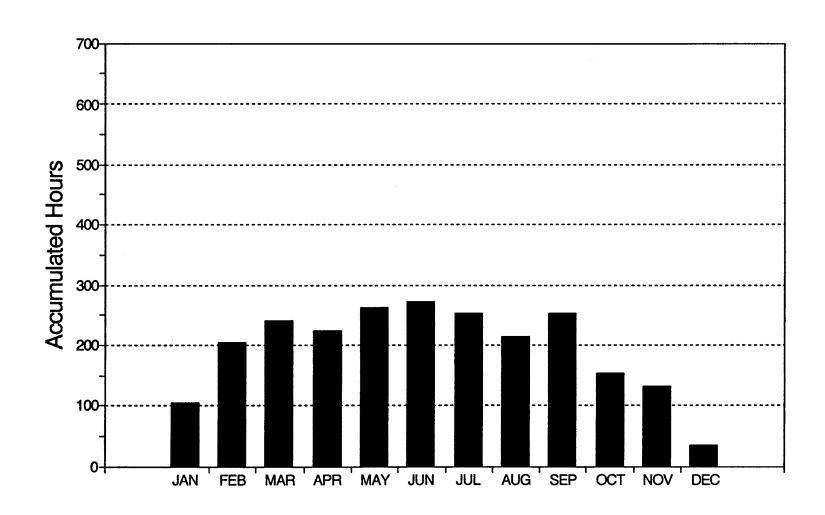

Site selection:

Field survey of topography.

5,200 ft.

South Central

3 East

40° 04'

Site Description

County:

Utah

Township:

8 South

Section:

34

111° 33' Longitude:

Duration of data logging:

August 1984 to May 1991

Elevation:

Quarter Section:

Range:

Latitude:

Months of available data: 51 Anemometer height:

60 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Southeast

Terrain classification in each of the principal directions:

North:

Low grass, fallow ground

East:

Low grass, fallow ground

South:

Low grass, fallow ground

West:

Low grass, fallow ground

Comments

Property ownership:

Private

Site Description

County:

Utah

Township:

8 South

Section:

34

Longitude:

111° 33'

Elevation:

5,200 ft.

Range:

3 East

Quarter Section:

Northwest

Latitude:

39° 59'

Duration of data logging:

July 1987 to May 1991

Months of available data: 33 Anemometer height:

65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Northeast-East

Terrain classification in each of the principal directions:

North: Low grass, low row crops

East:

Low grass, low row crops

South: Low grass, low row crops

West:

Low grass, low row crops

Comments

Property ownership:

Spanish Fork City

Site selection:

Field survey of topography

Site Description

County: Township: Utah

8 South

Section:

34

Longitude:

111° 33'

Elevation:

5,200 ft.

Range:

3 East

Quarter Section:

Northwest

Latitude:

40° 04'

Duration of data logging:

Months of available data: 33

Anemometer height:

60 ft.

Surrounding Environmental Conditions

Prevailing wind direction: East to South, varies with seasons Terrain classification in each of the principal directions:

North:

Low grass, low row crops

East:

Low grass, low row crops

South:

Low grass, low row crops

West:

Low grass, low row crops

Comments

Property ownership:

Spanish Fork City

Site selection:

Field survey of topography

August 1984 to May 1991

Site Description

County:

Utah

Township:

8 South

Section:

34

Longitude:

111° 33'

Elevation:

5,200 ft.

Range:

3 East

Quarter Section:

Latitude:

40° 04'

Duration of data logging:

May 1986 to May 1991

Months of available data: 20

Anemometer height:

60 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Southeast

Terrain classification in each of the principal directions:

North:

Low grass, low row crops

East:

Low grass, low row crops

South:

Low grass, low row crops

West:

Low grass, low row crops

Comments

Property ownership:

Spanish Fork City

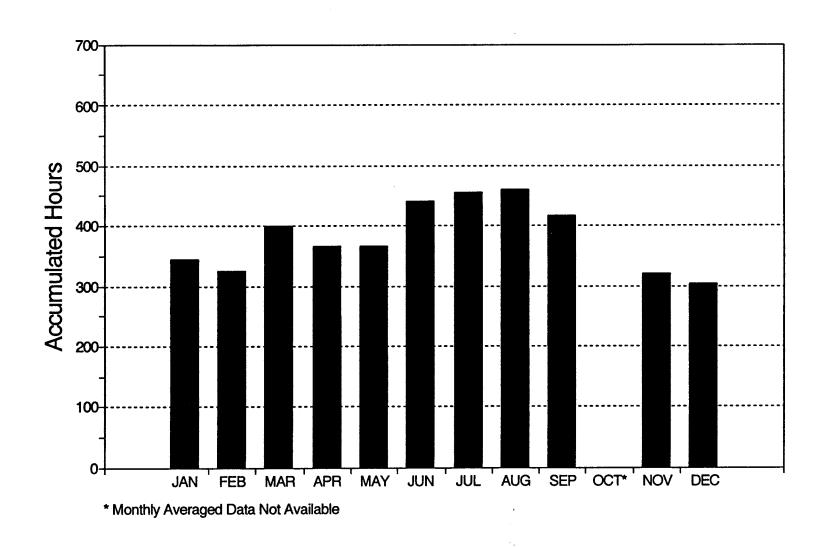

Site selection:

Field survey of topography

8.000 ft.

9 West

40° 10'

Site Description

County:

Wasatch

Township:

3 South

Section:

31

Longitude:

110° 50'

May 1985 to August 1986

Elevation:

Quarter Section:

Range:

Latitude:

Months of available data: 15 Anemometer height:

Duration of data logging:

65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: West-Northwest

Terrain classification in each of the principal directions:

North:

High grass, low row crops

East:

High grass, low row crops

South:

High grass, low row crops

West:

High grass, low row crops

Comments

Property ownership:

Site Description

County:

Washington

Township:

40 South

Section:

34

Longitude:

113° 38'

Elevation:

3,800 ft.

Range:

16 West

Quarter Section:

Northeast

Latitude:

37° 18'

Duration of data logging: **January 1985 to July 1989**

Months of available data: 41 Anemometer height:

65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Northwest-north

Terrain classification in each of the principal directions:

North: East:

Rolling terrain Rolling terrain

South:

Low grass, low row crops

West:

Rolling terrain

Site Description

County:

Washington

Township:

41 South

Section:

31

Longitude:

113° 38'

Elevation:

3,200 ft.

Range:

16 West

Quarter Section:

Latitude:

37° 12'

Duration of data logging:

January 1985 to July 1985

Months of available data: 7
Anemometer height: 69

65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Not available, faulty wind vane Terrain classification in each of the principal directions:

North:

Rolling terrain

East:

Low grass, low row crops

South:

Low grass, low row crops

West:

Rolling terrain

Site Description

County:

Washington

Elevation:

3,000 ft.

Township:

42 South

Range:

15 West

Section:

19

Quarter Section: -

· · · ·

Longitude:

113° 35'

Latitude:

37° 07'

Duration of data logging:

December 1986 to December 1988

Months of available data:
Anemometer height:

14 30 ft.

Surrounding Environmental Conditions

Prevailing wind direction: West

Terrain classification in each of the principal directions:

North:

Rolling terrain

East:

Rolling terrain

South:

Rolling terrain

West:

Rolling terrain

Comments

Property ownership:

Mobile Telephone of Southern Utah Incorporated

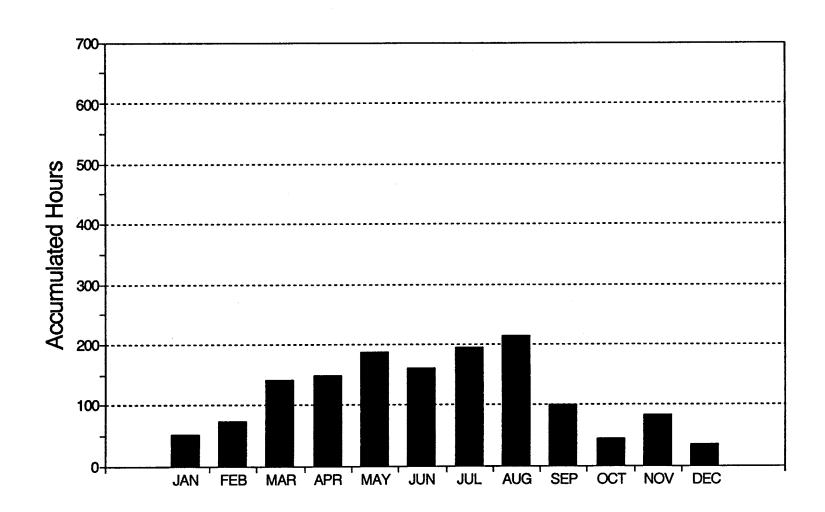

Site selection:

Field survey of topography

Wind Rose Data Table	327

Site Description

County:

Wayne

Township:

29 South

Section:

11

Longitude:

111° 25'

Elevation:

6,600 ft.

Range:

4 East

Quarter Section:

Southwest

Latitude:

38° 20'

Duration of data logging:

May 1985 to July 1985 Months of available data: 3

Anemometer height:

65 ft.

Surrounding Environmental Conditions

Prevailing wind direction: Not available, faulty wind vane Terrain classification in each of the principal directions:

North:

High grass, low row crops

East:

High grass, low row crops

South:

High grass, low row crops

West:

High grass, low row crops

Comments

Property ownership:

Private
